Design and Function

Dual Flow Pump is a Piston Pump with spherical pistons.

Including Piston Rings. The pistons are working at the angle of 40 degree to the shaft. When the shaft rotates, the pistons move up and down in the cylinder barrel, forcing the oil to pass from the inlet port to the outlet in the end cap.

A ring gear connects the cylinder barrel to the drive shaft, causing these to rotate at the same speed.

A barrel support with a spring presses the cylinder barrel against the end cap.

An internal connection from the housing to the suction port eliminates a separate draining line to the tank. Double Flow Pumps provided with shaft and connection flange that fits direct to PTO's with ZF Standard.

Inlet/Suction Fittings included with Dual Flow Piston Pumps.

User guide and Installation Instructions included.

Applications

DUAL FLOW PUMP bypass valve

- A dual/twin pump fitted with a bypass valve can be utilised in applications where the pump is operating constantly i.e. when the pump is driven from the crankshaft through a cardan shaft, or when it is installed on an engine-PTO. In addition, it can be used when, temporarily, one of the two circuits is not required; the power loss is thus reduced as the non-required flow is not forced through lines and 'open center' valves.
- The DUAL bypass valve should be disengaged during transportation when the pump is operating constantly and the engine is running at max rpm; the hydraulic system is not sized for the large flow that would otherwise go through it.
- The DUAL valve connects the outlet and inlet ports of the pump, and only a small oil flow goes through the system and to the reservoir.
- The valve is installed directly on top of the pump port surface with 'banjo' fittings and two cap screws (refer to the split view to the right).
- As the DUAL valve is symmetrical it can be 'turned 180°' so as not to interfere with chassis components. The valve can accommodate left hand as well as right hand rotating pumps.
- The valve can only be engaged or disengaged (through the 24 or 12 VDC solenoid) at low system pressures (below 20 bar).

IMPORTANT INFORMATION

- In order to secure a cooling flow through the system, a separate drain line **must** be connected from the BPV-pump drain line fitting (shown in the split view) directly to tank; refer also to the schematic.
- The pressure connectors must be tightened (to 50 Nm) before the suction fitting clamp screws are tightened.

NOTE: A suction fitting kit (parts designated '2' in the split view) is **not** included with the pump; it must be ordered separately.
